In metal carbonyls: Metal–carbon bond possess both σ and π character

Crystal field theory: Ligands are point charges and there is electrostatic force of attraction between ligands and metal atom/ion. Degeneracy of d orbitals is lighted causing splitting of d orbitals. Δ_0 depends upon the field produced by the ligand and charge on metal ion.

Colour
Caused by d-d transition; the colour is complementary to wavelength absorbed

Werner's Theory: Postulates
- In coordination compounds metals show primary and secondary linkages (valances)
- Primary valences are ionisable and are satisfied by negative ions.
- Secondary valences are non-ionisable and are satisfied by neutral molecules or negative ions.
- Ions/groups bound by secondary linkages to metal have characteristic spatial arrangements corresponding to different coordination numbers.

Uses

Types of Polymerization Reactions

- (i) Addition/Chain Growth : Molecules of the same/different monomers add together on a large scale.
  Free radical mechanism :
  (a) Chain initiation step:
  $C_6H_5–CO–O–O–CO–C_6H_5 \longrightarrow 2C_6H_5–CO–\dot{O} \longrightarrow 2\dot{C}_6H_5$
  $\dot{C}_6H_5 + CH_2 = CH_2 \longrightarrow C_6H_5–CH_2–\dot{C}H_2$
  (b) Chain propagating step:
  $C_6H_5–CH_2–\dot{C}H_2 + CH_2 = CH_2 \longrightarrow C_6H_5–CH_2–CH_2–CH_2–\dot{C}H_2 \longrightarrow C_6H_5–(CH_2–CH_2)_n–CH_2–\dot{C}H_2$
  (c) Chain terminating step:
  $2[C_6H_5–(CH_2–CH_2)_n–\dot{C}H_2–CH_2] \longrightarrow C_6H_5–(CH_2–CH_2)_n–CH_2–CH_2 – CH_2–(CH_2 – CH_2)_n–C_6H_5$

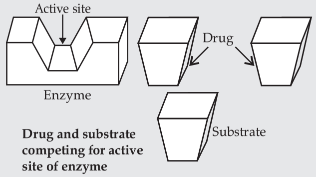
Chemistry in Everyday Life

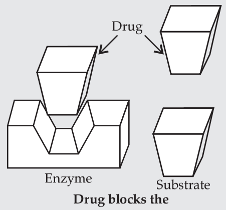
Medicines: Chemicals which generate therapeutic and useful biological response

- Drugs are chemicals of low molecular masses. Interact with macromolecular targets to produce a biological response.
- **Classification of drugs:**
  - (a) On the basis of pharmalogical effect : Provides range of drugs available for a particular type of problem. (Analgesics, Antiseptics).
  - (b) On the basis of drugs action : (Antihistamines inhibit action of histamine responsible for causing inflammation in the body.
  - (c) On the basis of chemical structure : Common structural features. (Sulphonamides)
  - (d) On the basis of molecular targets : Most useful.
- **Drugs Target Interaction:**
  - (i) Enzymes as Drug Targets
    - (a) Catalytic action of enzymes

    - (b) Drug–enzyme interaction



Drug and substrate competing for active site of enzyme



Drug blocks the active site of enzyme

  - (ii) **Receptors as Drug Targets**: Receptors are proteins crucial for body's communication and are embedded in cell membrane.

Therapeutic Action of Different Classes of Drugs

- **Antacids :** Substances that neutralize the excess HCl and raise pH in stomach (Ranitidine, Cimetidine)
- **Antihistamines :** Interfere with natural action of histamine by competing with histamine for binding sites of receptor where histamine exerts its effect
- **Neurologically Active Drugs**
  - (a) **Tranquilizers :** Class of chemical compounds used for the treatment of stress and mild or even severe mental diseases. (Iproniazid, Phenelzine)
